- Blackouts

Long Term:

- Liver Disease
- Ulcers
- Cancer of Mouth
- Cancer of Throat
- Stroke
- High Blood Pressure
- Nerve Damage
- Gastritis
- Malnutrition
- Family problems & Broken relationships

What is Palcohol?

Palcohol is simply freeze-dried alcohol in powder form, packaged in small packets that promise an easy way to take a stiff drink on the go.

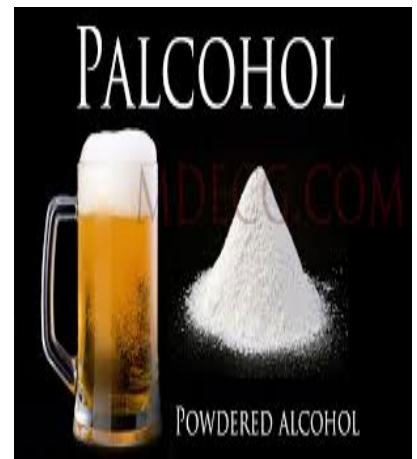

The new powdery substance can also be inhaled like illicit drugs such as cocaine and heroin. This would transmit the substance through the sinuses to the brain-blood barrier, which would result in an immediate high.

What is it?

- One package weighs about an ounce and is small enough to fit into any pocket. Making it easy for anyone to conceal.
- The convenience of the packets could encourage over-consumption of alcohol, as well as accidents caused by intoxication, such as drunk driving.
- The other concern is that given the flavors it comes in, there is the

potential for it to be very appealing to a younger population
